

Human Milk is Green *Ecologically speaking...*

It's a natural, renewable resource and is all the baby needs for the first six months of life.

It requires no resources for packaging, shipping or disposal.

No precious energy is wasted producing artificial baby milk and related products.

No land needs to be deforested for pasture or crop production.

It does not create pollution from the manufacturing of human milk substitutes, bottles, nipples and cans.

It helps space babies by suppressing fertility in the mother.
